Chapter 1

Introduction to FTP

The File Transfer Protocol (FTP) is a protocol designed for file transfers. FTP utilizes reliable Transmission Control Protocol (TCP) services to perform its file transfer function. Because of this, FTP is a highly reliable file transfer protocol. FTP is also high-performance. The actual FTP file transfer is performed on a dedicated FTP connection.

FTP Requirements

In order to function properly, the NetX FTP package requires that a NetX IP instance has already been created. In addition, TCP must be enabled on that same IP instance. The FTP Client portion of the NetX FTP package has no further requirements.

The FTP Server portion of the NetX FTP package has several additional requirements. First, it requires complete access to TCP *well-known port 21* for handling all Client FTP command requests and *well-known port 20* for handling all Client FTP data transfers. The FTP Server is also designed for use with the FileX embedded file system. If FileX is not available, the user may port the portions of FileX used to their own environment. This is discussed in later sections of this guide.

FTP Constraints

The FTP standard has many options regarding the representation of file data. Similar to Unix implementations, NetX FTP assumes the following file format constraints:

File Type:	Binary
File Format:	Nonprint Only
File Structure:	File Structure Only
Transmission Mode:	Stream Mode Only

FTP File Names

FTP file names should be in the format of the target file system (usually FileX). They should be NULL terminated ASCII strings, with full path information if necessary. There is no specified limit for the size of FTP file names in the NetX FTP implementation. However, the packet pool payload size should be able to accommodate the maximum path and/or file name.

FTP Client Commands

The FTP has a simple mechanism for opening connections and performing file and directory operations. There is basically a set of standard FTP commands that are issued by the Client after a connection has been successfully established on the TCP *well-known port 21*. The following shows some of the basic FTP commands:

FTP Command	Meaning
CWD path	<i>Change working directory</i>
DELE filename	<i>Delete specified file name</i>
LIST directory	<i>Get directory listing</i>
MKD directory	<i>Make new directory</i>
NLST directory	<i>Get directory listing</i>
NOOP	<i>No operation, returns success</i>
PASS password	<i>Provide password for login</i>
PASV	<i>Request passive transfer mode</i>
PWD path	<i>Pickup current directory path</i>
QUIT	<i>Terminate Client connection</i>
RETR filename	<i>Read specified file</i>
RMD directory	<i>Delete specified directory</i>
RNFR oldfilename	<i>Specify file to rename</i>
RNTO newfilename	<i>Rename file to supplied file name</i>
STOR filename	<i>Write specified file</i>
TYPE I	<i>Select binary file image</i>
USER username	<i>Provide username for login</i>
PORT ip_address,port	<i>Provide IP address and Client data port</i>

These ASCII commands are used internally by the NetX FTP Client software to perform FTP operations with the FTP Server.

FTP Server Responses

The FTP Server utilizes the *well-known TCP port 21* to field Client command requests. Once the FTP Server processes the Client command, it returns a 3-digit numeric response in ASCII followed by an optional ASCII string. The numeric response is used by the FTP Client software to determine whether the operation succeeded or failed. The following lists various FTP Server responses to Client commands:

First Numeric Field	Meaning
1xx	<i>Positive preliminary status – another reply coming.</i>
2xx	<i>Positive completion status.</i>
3xx	<i>Positive preliminary status – another command must be sent.</i>
4xx	<i>Temporary error condition.</i>
5xx	<i>Error condition.</i>

Second Numeric Field	Meaning
x0x	Syntax error in command.
x1x	Informational message.
x2x	Connection related.
x3x	Authentication related.
x4x	Unspecified.
x5x	File system related.

For example, a Client request to disconnect an FTP connection with the QUIT command will typically be responded with a “221” code from the Server – if the disconnect is successful.

FTP Passive Transfer Mode

By default, the NetX FTP Client uses the active transport mode to exchange data over the data socket with the FTP server. The problem with this arrangement is that it requires the FTP Client to open a TCP server socket for the FTP Server to connect to. This represents a possible security risk and may be blocked by the Client firewall. Passive transfer mode differs from active transport mode by having the FTP server create the TCP server socket on the data connection. This eliminates the security risk (for the FTP Client).

To enable passive data transfer, the application calls `nx_ftp_client_passive_mode_set` on a previously created FTP Client with the second argument set to `NX_TRUE`. Thereafter, all subsequent NetX FTP Client services for transferring data (NLST, RETR, STOR) are attempted in the passive transport mode.

The FTP Client first sends the PASV command (no arguments). If the FTP server supports this request it will return the 227 "OK" response. Then the Client sends the request e.g. RETR. If the server refuses passive transfer mode, the NetX FTP Client service returns an error status.

To disable passive transport mode and return to active transport mode, the application calls `nx_ftp_client_passive_mode_set` with the second argument set to `NX_FALSE`.

PASV only supports IPv4 connections. For IPv6, passive mode transfer uses the EPSV command which is not supported in the current NetX FTP Client release.

Refer to the demo program, `demo_netxdue_ftp_client_passive.c` for how to use the passive mode feature.

FTP Communication

The FTP Server utilizes the *well-known TCP port 21* to field Client requests. FTP Clients may use any available TCP port. The general sequence of FTP events is as follows:

FTP Read File Requests:

1. Client issues TCP connect to Server port 21.
2. Server sends "220" response to signal success.
3. Client sends "USER" message with "username."
4. Server sends "331" response to signal success.
5. Client sends "PASS" message with "password."
6. Server sends "230" response to signal success.
7. Client sends "TYPE I" message for binary transfer.
8. Server sends "200" response to signal success.
9. Client sends "PORT" message with IP address and port.
10. Server sends "200" response to signal success.
11. Client sends "RETR" message with file name to read.

12. Server creates data socket and connects with client data port specified in the "PORT" command.
13. Server sends "125" response to signal file read has started.
14. Server sends contents of file through the data connection. This process continues until file is completely transferred.
15. When finished, Server disconnects data connection.
16. Server sends "250" response to signal file read is successful.
17. Clients sends "QUIT" to terminate FTP connection.
18. Server sends "221" response to signal disconnect is successful.
19. Server disconnects FTP connection.

As mentioned previously, the only difference between FTP running over IPv4 and IPv6 is the PORT command is replaced with the EPRT command for IPv6

If the FTP Client makes a read request in the passive transfer mode, the command sequence is as follows (**bolded** lines indicates a different step from active transfer mode):

1. Client issues TCP connect to Server port 21.
2. Server sends "220" response to signal success.
3. Client sends "USER" message with "username."
4. Server sends "331" response to signal success.
5. Client sends "PASS" message with "password."
6. Server sends "230" response to signal success.
7. Client sends "TYPE I" message for binary transfer.
8. Server sends "200" response to signal success.
9. **Client sends "PASV" message.**
10. **Server sends "227" response, and IP address and port for the Client to connect to, to signal success.**
11. Client sends "RETR" message with file name to read.
12. **Server creates data server socket and listens for the Client connect request on this socket using the port specified in the "227" response.**
13. **Server sends "150" response on the control socket to signal file read has started.**
14. Server sends contents of file through the data connection. This process continues until file is completely transferred.
15. When finished, Server disconnects data connection.
16. **Server sends "226" response on the control socket to signal file read is successful.**
17. Client sends "QUIT" to terminate FTP connection.
18. Server sends "221" response to signal disconnect is successful.
19. Server disconnects FTP connection.

FTP Write Requests:

1. Client issues TCP connect to Server port 21.
2. Server sends "220" response to signal success.
3. Client sends "USER" message with "username."
4. Server sends "331" response to signal success.
5. Client sends "PASS" message with "password."
6. Server sends "230" response to signal success.
7. Client sends "TYPE I" message for binary transfer.
8. Server sends "200" response to signal success.
9. Client sends "PORT" message with IP address and port.
10. Server sends "200" response to signal success.
11. Client sends "STOR" message with file name to write.
12. Server creates data socket and connects with client data port specified in the "PORT" command.
13. Server sends "125" response to signal file write has started.
14. Client sends contents of file through the data connection.
This process continues until file is completely transferred.
15. When finished, Client disconnects data connection.
16. Server sends "250" response to signal file write is successful.
17. Clients sends "QUIT" to terminate FTP connection.
18. Server sends "221" response to signal disconnect is successful.
19. Server disconnects FTP connection.

If the FTP Client makes a write request in the passive transfer mode, the command sequence is as follows (**bolded** lines indicates a different step from active transfer mode):

1. Client issues TCP connect to Server port 21.
2. Server sends "220" response to signal success.
3. Client sends "USER" message with "username."
4. Server sends "331" response to signal success.
5. Client sends "PASS" message with "password."
6. Server sends "230" response to signal success.
7. Client sends "TYPE I" message for binary transfer.
8. Server sends "200" response to signal success.
9. **Client sends "PASV" message.**
10. **Server sends "227" response, and IP address and port for the Client to connect to, to signal success.**
11. Client sends "STOR" message with file name to write.
12. **Server creates data server socket and listens for the**

Client connect request on this socket using the port specified in the “227” response.

13. **Server sends “150” response on the control socket to signal file write has started.**
14. Client sends contents of file through the data connection. This process continues until file is completely transferred.
15. When finished, Client disconnects data connection.
16. **Server sends “226” response on the control socket to signal file write is successful.**
17. Client sends “QUIT” to terminate FTP connection.
18. Server sends “221” response to signal disconnect is successful.
19. Server disconnects FTP connection.

FTP Authentication

Whenever an FTP connection takes place, the Client must provide the Server with a *username* and *password*. Some FTP sites allow what is called *Anonymous FTP*, which allows FTP access without a specific username and password. For this type of connection, “anonymous” should be supplied for username and the password should be a complete e-mail address.

The user is responsible for supplying NetX FTP with login and logout authentication routines. These are supplied during the ***nx_ftp_server_create*** function and called from the password processing. If the *login* function returns NX_SUCCESS, the connection is authenticated and FTP operations are allowed. Otherwise, if the *login* function returns something other than NX_SUCCESS, the connection attempt is rejected.

FTP Multi-Thread Support

The NetX FTP Client services can be called from multiple threads simultaneously. However, read or write requests for a particular FTP Client instance should be done in sequence from the same thread.

FTP RFCs

NetX FTP is compliant with RFC959 and related RFCs.

Chapter 2

Installation and Use of FTP

This chapter contains a description of various issues related to installation, setup, and usage of the NetX FTP component.

Product Distribution

FTP for NetX is shipped on a single CD-ROM compatible disk. The package includes two source files and a PDF file that contains this document, as follows:

<code>nx_ftp.h</code>	Header file for FTP for NetX
<code>nx_ftp_client.c</code>	C Source file for FTP Client for NetX
<code>nx_ftp_server.c</code>	C Source file for FTP Server for NetX
<code>filex_stub.h</code>	Stub file if FileX is not present
<code>nx_ftp.pdf</code>	PDF description of FTP for NetX
<code>demo_netx_ftp.c</code>	FTP demonstration system
<code>demo_netxduo_ftp_client_passive.c</code>	FTP demonstration of file download (read) and upload (write) in passive transfer mode

FTP Installation

In order to use FTP for NetX, the entire distribution mentioned previously should be copied to the same directory where NetX is installed. For example, if NetX is installed in the directory “`\threadx\arm7\green`” then the `nx_ftp.h`, `nx_ftp_client.c`, and `nx_ftp_server.c` files should be copied into this directory.

Using FTP

Using FTP for NetX is easy. Basically, the application code must include `nx_ftp.h` after it includes `tx_api.h`, `fx_api.h`, and `nx_api.h`, in order to use ThreadX, FileX, and NetX, respectively. Once `nx_ftp.h` is included, the application code is then able to make the FTP function calls specified later in this guide. The application must also include `nx_ftp_client.c` and `nx_ftp_server.c` in the build process. These files must be compiled in the same manner as other application files and its object form must be linked along with the files of the application. This is all that is required to use NetX FTP.

Note that since FTP utilizes NetX TCP services, TCP must be enabled with the *nx_tcp_enable* call prior to using FTP.

Small Example System

An example of how easy it is to use NetX FTP is described in Figure 1.1 that appears below.

Note this is for a host device with a single network interface.

In this example, the FTP include file *nx_ftp_client.h* and *nx_ftp_server.h* are brought at line 10 and 11. Next, the FTP Server is created in “*tx_application_define*” at line 134. Note that the FTP Server control block “*Server*” was defined as a global variable at line 31 previously. After successful creation, an FTP Server is started at line 363. At line 183 the FTP Client is created. And finally, the Client writes the file at line 229 and reads the file back at line 318.

```

Figure 1.1 Example of FTP Client and Server with NetX
(Single network interface host)

Configuration Options

There are several configuration options for building FTP for NetX. The following list describes each in detail:

Define	Meaning
NX_FTP_SERVER_PRIORITY	The priority of the FTP Server thread. By default, this value is defined as 16 to specify priority 16.
NX_FTP_MAX_CLIENTS	The maximum number of Clients the Server can handle at one time. By default, this value is 4 to support 4 Clients at once.
NX_FTP_NO_FILEX	Defined, this option provides a stub for FileX dependencies. The FTP Client will function without any change if this option is defined. The FTP Server will need to either be modified or the user will have to create a handful of FileX services in order to function properly.
NX_FTP_CONTROL_TOS	Type of service required for the FTP TCP control requests. By default, this value is defined as NX_IP_NORMAL to indicate normal IP packet service. This define can be set by the application prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_DATA_TOS	Type of service required for the FTP TCP data requests. By default, this value is defined as NX_IP_NORMAL to indicate normal IP packet service. This define can be set by the application prior to inclusion of <i>nx_ftp.h</i> .

NX_FTP_FRAGMENT_OPTION	Fragment enable for FTP TCP requests. By default, this value is <code>NX_DONT_FRAGMENT</code> to disable FTP TCP fragmenting. This define can be set by the application prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_CONTROL_WINDOW_SIZE	Control socket window size. By default, this value is 400 bytes. This define can be set by the application prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_DATA_WINDOW_SIZE	Data socket window size. By default, this value is 2048 bytes. This define can be set by the application prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_TIME_TO_LIVE	Specifies the number of routers this packet can pass before it is discarded. The default value is set to 0x80, but can be redefined prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_SERVER_TIMEOUT	Specifies the number of ThreadX ticks that internal services will suspend for. The default value is set to 100, but can be redefined prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_USERNAME_SIZE	Specifies the number of bytes allowed in a client supplied <i>username</i> . The default value is set to 20, but can be redefined prior to inclusion of <i>nx_ftp.h</i> .
NX_FTP_PASSWORD_SIZE	Specifies the number of bytes allowed in a client supplied <i>password</i> . The default value

is set to 20, but can be redefined prior to inclusion of *nx_ftp.h*.

NX_FTP_ACTIVITY_TIMEOUT

Specifies the number of seconds a client connection is maintained if there is no activity. The default value is set to 240, but can be redefined prior to inclusion of *nx_ftp.h*.

NX_FTP_TIMEOUT_PERIOD

Specifies the number of seconds between the Server checking for client inactivity. The default value is set to 60, but can be redefined prior to inclusion of *nx_ftp.h*.

Chapter 3

Description of FTP Services

This chapter contains a description of all NetX FTP services (listed below) in alphabetic order.

In the “Return Values” section in the following API descriptions, values in **BOLD** are not affected by the **NX_DISABLE_ERROR_CHECKING** define that is used to disable API error checking, while non-bold values are completely disabled.

`nx_ftp_client_connect`
Connect to FTP Server

`nx_ftp_client_create`
Create an FTP Client instance

`nx_ftp_client_delete`
Delete an FTP Client instance

`nx_ftp_client_directory_create`
Create a directory on Server

`nx_ftp_client_directory_default_set`
Set default directory on Server

`nx_ftp_client_directory_delete`
Delete a directory on Server

`nx_ftp_client_directory_listing_get`
Get directory listing from Server

`nx_ftp_client_directory_listing_continue`
Continue directory listing from Server

`nx_ftp_client_disconnect`
Disconnect from FTP Server

`nx_ftp_client_file_close`
Close Client file

`nx_ftp_client_file_delete`

Delete file on Server

`nx_ftp_client_file_open`
Open Client file

`nx_ftp_client_file_read`
Read from file

`nx_ftp_client_file_rename`
Rename file on Server

`nx_ftp_client_file_write`
Write to file

`nx_ftp_server_create`
Create FTP Server

`nx_ftp_server_delete`
Delete FTP Server

`nx_ftp_server_start`
Start FTP Server

`nx_ftp_server_stop`
Stop FTP Server

nx_ftp_client_connect

Connect to an FTP Server

Prototype

```
UINT nx_ftp_client_connect(NX_FTP_CLIENT *ftp_client_ptr,
                          ULONG server_ip, CHAR *username, CHAR *password,
                          ULONG wait_option);
```

Description

This service connects the previously created FTP Client instance to the FTP Server at the supplied IP address.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
server_ip	IP address of FTP Server.
username	Client username for authentication.
password	Client password for authentication.
wait_option	Defines how long the service will wait for the FTP Client connection. The wait options are defined as follows: <div style="margin-left: 40px;"> <p>timeout value (0x00000001 through 0xFFFFFFFFE)</p> <p>TX_WAIT_FOREVER (0xFFFFFFFF)</p> <p>Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.</p> <p>Selecting a numeric value (1-0xFFFFFFFFE) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.</p> </div>

Return Values

NX_SUCCESS (0x00)	Successful FTP connection.
NX_TFTP_EXPECTED_22X_CODE	

NX_FTP_EXPECTED_23X_CODE	(0xDB)	Did not get a 22X (ok) response
NX_FTP_EXPECTED_33X_CODE	(0xDC)	Did not get a 23X (ok) response
	(0xDE)	Did not get a 33X (ok) response
NX_FTP_NOT_DISCONNECTED		
NX_PTR_ERROR	(0xD4)	Client is already connected.
NX_CALLER_ERROR	(0x07)	Invalid pointer inout.
NX_IP_ADDRESS_ERROR	(0x11)	Invalid caller of this service.
	(0x21)	Invalid IP address.

Allowed From

Threads

Example

```

/* Connect the FTP Client instance "my_client" to the FTP Server at
   IP address 1.2.3.4. */
status = nx_ftp_client_connect(&my_client, IP_ADDRESS(1,2,3,4), NULL, NULL, 100);

/* If status is NX_SUCCESS an FTP Client instance was successfully
   connected to the FTP Server. */

```

nx_ftp_client_create

Create an FTP Client instance

Prototype

```
UINT nx_ftp_client_create(NX_FTP_CLIENT *ftp_client_ptr,
                        CHAR *ftp_client_name, NX_IP *ip_ptr, ULONG window_size,
                        NX_PACKET_POOL *pool_ptr);
```

Description

This service creates an FTP Client instance.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
ftp_client_name	Name of FTP Client.
ip_ptr	Pointer to previously created IP instance.
window_size	Advertised window size for TCP sockets of this FTP Client.
pool_ptr	Pointer to the default packet pool for this FTP Client. Note that the minimum packet payload must be large enough to hold complete path and the file or directory name.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Client create.
NX_PTR_ERROR	(0x16)	Invalid FTP, IP pointer, or packet pool pointer. password pointer.

Allowed From

Initialization and Threads

Example

```
/* Create the FTP Client instance "my_client." */
status = nx_ftp_client_create(&my_client, "My Client", &client_ip,
                             2000, &client_pool);

/* If status is NX_SUCCESS the FTP Client instance was successfully
   created. */
```

nx_ftp_client_delete

Delete an FTP Client instance

Prototype

```
UINT nx_ftp_client_delete(NX_FTP_CLIENT *ftp_client_ptr);
```

Description

This service deletes an FTP Client instance.

Input Parameters

ftp_client_ptr Pointer to FTP Client control block.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Client delete.
NX_FTP_NOT_DISCONNECTED	(0xD4)	FTP Client delete error.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Delete the FTP Client instance "my_client." */
status = nx_ftp_client_delete(&my_client);

/* If status is NX_SUCCESS the FTP Client instance was successfully
   deleted. */
```

nx_ftp_client_directory_create

Create a directory on FTP Server

Prototype

```
UINT nx_ftp_client_directory_create(NX_FTP_CLIENT *ftp_client_ptr,
    CHAR *directory_name, ULONG wait_option);
```

Description

This service creates the specified directory on the FTP Server that is connected to the specified FTP Client.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
directory_name	Name of directory to create.
wait_option	Defines how long the service will wait for the FTP directory create. The wait options are defined as follows:

timeout value (0x00000001 through 0xFFFFFFFF)

TX_WAIT_FOREVER (0xFFFFFFFF)

Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.

Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP directory create.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Create the directory "my_dir" on the FTP Server connected to
   the FTP Client instance "my_client." */
status = nx_ftp_client_directory_create(&my_client, "my_dir", 200);

/* If status is NX_SUCCESS the directory "my_dir" was successfully
   created. */
```

nx_ftp_client_directory_default_set

Set default directory on FTP Server

Prototype

```
UINT nx_ftp_client_directory_default_set(NX_FTP_CLIENT *ftp_client_ptr,
                                         CHAR *directory_path, ULONG wait_option);
```

Description

This service sets the default directory on the FTP Server that is connected to the specified FTP Client. This default directory applies only to this client's connection.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
directory_path	Name of directory path to set.
wait_option	Defines how long the service will wait for the FTP default directory set. The wait options are defined as follows:

timeout value (0x00000001 through 0xFFFFFFFF)

TX_WAIT_FOREVER (0xFFFFFFFF)

Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.

Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP default set.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.

NX_CALLER_ERROR (0x11) Invalid caller of this service.

Allowed From

Threads

Example

```
/* Set the default directory to "my_dir" on the FTP Server connected to
   the FTP Client instance "my_client." */
status = nx_ftp_client_directory_default_set(&my_client, "my_dir", 200);

/* If status is NX_SUCCESS the directory "my_dir" is the default directory. */
```

nx_ftp_client_directory_delete

Delete directory on FTP Server

Prototype

```
UINT nx_ftp_client_directory_delete(NX_FTP_CLIENT *ftp_client_ptr,
    CHAR *directory_name, ULONG wait_option);
```

Description

This service deletes the specified directory on the FTP Server that is connected to the specified FTP Client.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
directory_name	Name of directory to delete.
wait_option	Defines how long the service will wait for the FTP directory delete. The wait options are defined as follows:

timeout value (0x00000001 through 0xFFFFFFFF)

TX_WAIT_FOREVER (0xFFFFFFFF)

Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.

Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP directory delete.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Delete directory "my_dir" on the FTP Server connected to  
   the FTP Client instance "my_client." */  
status = nx_ftp_client_directory_delete(&my_client, "my_dir", 200);  
  
/* If status is NX_SUCCESS the directory "my_dir" is deleted. */
```

nx_ftp_client_directory_listing_get

Get directory listing from FTP Server

Prototype

```
UINT nx_ftp_client_directory_listing_get(NX_FTP_CLIENT *ftp_client_ptr,
    CHAR *directory_name, NX_PACKET **packet_ptr,
    ULONG wait_option);
```

Description

This service gets the contents of the specified directory on the FTP Server that is connected to the specified FTP Client. The supplied packet pointer will contain one or more directory entries. Each entry is separated by a <cr/lf> combination. The ***nx_ftp_client_directory_listing_continue*** should be called to complete the directory get operation.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
directory_name	Name of directory to get contents of.
packet_ptr	Pointer to destination packet pointer. If successful, the packet payload will contain one or more directory entries.
wait_option	Defines how long the service will wait for the FTP directory listing. The wait options are defined as follows:

timeout value	(0x00000001 through 0xFFFFFFFF)
TX_WAIT_FOREVER	(0xFFFFFFFF)

Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.

Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP directory listing.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_NOT_ENABLED	(0x14)	Service (IPv6) not enabled
NX_FTP_EXPECTED_1XX_CODE	(0xD9)	Did not get a 1XX (ok) response
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```

/* Get the contents of directory "my_dir" on the FTP Server connected to
   the FTP Client instance "my_client." */
status = nx_ftp_client_directory_listing_get(&my_client, "my_dir", &my_packet,
                                             200);

/* If status is NX_SUCCESS, one or more entries of the directory "my_dir"
   can be found in "my_packet". */

```

nx_ftp_client_directory_listing_continue

Continue directory listing from FTP Server

Prototype

```
UINT nx_ftp_client_directory_listing_continue(NX_FTP_CLIENT
      *ftp_client_ptr, NX_PACKET **packet_ptr,
      ULONG wait_option);
```

Description

This service continues getting the contents of the specified directory on the FTP Server that is connected to the specified FTP Client. It should have been immediately preceded by a call to ***nx_ftp_client_directory_listing_get***. If successful, the supplied packet pointer will contain one or more directory entries. This routine should be called until an NX_FTP_END_OF_LISTING status is received.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
packet_ptr	Pointer to destination packet pointer. If successful, the packet payload will contain one or more directory entries, separated by a <cr/lf>.
wait_option	Defines how long the service will wait for the FTP directory listing. The wait options are defined as follows:

timeout value	(0x00000001 through 0xFFFFFFFF)
----------------------	---------------------------------

TX_WAIT_FOREVER	(0xFFFFFFFF)
------------------------	--------------

Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.

Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP directory listing.
NX_FTP_END_OF_LISTING	(0xD8)	No more entries in this directory.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```

/* Continue getting the contents of directory "my_dir" on the FTP Server
   connected to the FTP Client instance "my_client." */
status = nx_ftp_client_directory_listing_continue(&my_client, &my_packet,
                                                200);

/* If status is NX_SUCCESS, one or more entries of the directory "my_dir"
   can be found in "my_packet". */

```

nx_ftp_client_disconnect

Disconnect from FTP Server

Prototype

```
UINT nx_ftp_client_disconnect(NX_FTP_CLIENT *ftp_client_ptr,
                             ULONG wait_option);
```

Description

This service disconnects a previously established FTP Server connection with the specified FTP Client.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
wait_option	Defines how long the service will wait for the FTP Client disconnect. The wait options are defined as follows:
timeout value	(0x00000001 through 0xFFFFFFFF)
TX_WAIT_FOREVER	(0xFFFFFFFF)
	Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.
	Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP disconnect.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Disconnect "my_client" from the FTP Server. */  
status = nx_ftp_client_disconnect(&my_client, 200);  
  
/* If status is NX_SUCCESS, "my_client" has been disconnected. */
```

nx_ftp_client_file_close

Close Client file

Prototype

```
UINT nx_ftp_client_file_close(NX_FTP_CLIENT *ftp_client_ptr,
                             ULONG wait_option);
```

Description

This service closes a previously opened file on the FTP Server.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.				
wait_option	Defines how long the service will wait for the FTP Client file close. The wait options are defined as follows: <table data-bbox="613 982 1308 1102"> <tr> <td>timeout value</td><td>(0x00000001 through 0xFFFFFFFFE)</td></tr> <tr> <td>TX_WAIT_FOREVER</td><td>(0xFFFFFFFF)</td></tr> </table> <p>Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.</p> <p>Selecting a numeric value (1-0xFFFFFFFFE) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.</p>	timeout value	(0x00000001 through 0xFFFFFFFFE)	TX_WAIT_FOREVER	(0xFFFFFFFF)
timeout value	(0x00000001 through 0xFFFFFFFFE)				
TX_WAIT_FOREVER	(0xFFFFFFFF)				

Return Values

NX_SUCCESS	(0x00)	Successful FTP file close.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_NOT_OPEN	(0xD5)	File not open; cannot close it
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Close previously opened file of client "my_client" on the FTP Server. */
status = nx_ftp_client_file_close(&my_client, 200);

/* If status is NX_SUCCESS, the file opened previously in the "my_client" FTP
   connection has been closed. */
```

nx_ftp_client_file_delete

Delete file on FTP Server

Prototype

```
UINT nx_ftp_client_file_delete(NX_FTP_CLIENT *ftp_client_ptr,
                               CHAR *file_name, ULONG wait_option);
```

Description

This service deletes the specified file on the FTP Server.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
file_name	Name of file to delete.
wait_option	Defines how long the service will wait for the FTP Client file delete. The wait options are defined as follows:
timeout value	(0x00000001 through 0xFFFFFFFFE)
TX_WAIT_FOREVER	(0xFFFFFFFF)
	Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.
	Selecting a numeric value (1-0xFFFFFFFFE) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP file delete.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_2XX_CODE	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Delete the file "my_file.txt" on the FTP Server using the previously
   connected client "my_client." */
status = nx_ftp_client_file_delete(&my_client, "my_file.txt", 200);

/* If status is NX_SUCCESS, the file "my_file.txt" on the FTP Server is
   deleted. */
```

nx_ftp_client_file_open

Opens file on FTP Server

Prototype

```
UINT nx_ftp_client_file_open(NX_FTP_CLIENT *ftp_client_ptr,
                             CHAR *file_name, UINT open_type, ULONG wait_option);
```

Description

This service opens the specified file – for reading or writing – on the FTP Server previously connected to the specified Client instance.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.				
file_name	Name of file to open.				
open_type	Either NX_FTP_OPEN_FOR_READ or NX_FTP_OPEN_FOR_WRITE .				
wait_option	Defines how long the service will wait for the FTP Client file open. The wait options are defined as follows: <table data-bbox="613 1234 1308 1348"> <tr> <td>timeout value</td><td>(0x00000001 through 0xFFFFFFFF)</td></tr> <tr> <td>TX_WAIT_FOREVER</td><td>(0xFFFFFFFF)</td></tr> </table> <p>Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.</p> <p>Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.</p>	timeout value	(0x00000001 through 0xFFFFFFFF)	TX_WAIT_FOREVER	(0xFFFFFFFF)
timeout value	(0x00000001 through 0xFFFFFFFF)				
TX_WAIT_FOREVER	(0xFFFFFFFF)				

Return Values

NX_SUCCESS	(0x00)	Successful FTP file open.
NX_OPTION_ERROR	(0x0A)	Invalid open type.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.

NX_FTP_NOT_CLOSED	(0xD6)	FTP Client is already opened.
NX_NO_FREE_PORTS	(0x45)	No TCP ports available to assign
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

.

Allowed From

Threads

Example

```
/* Open the file "my_file.txt" for reading on the FTP Server using the previously
   connected client "my_client." */
status = nx_ftp_client_file_open(&my_client, "my_file.txt", NX_FTP_OPEN_FOR_READ,
                                200);
```

```
/* If status is NX_SUCCESS, the file "my_file.txt" on the FTP Server is
   open for reading. */
```

nx_ftp_client_file_read

Read from file

Prototype

```
UINT nx_ftp_client_file_read(NX_FTP_CLIENT *ftp_client_ptr,
                             NX_PACKET **packet_ptr, ULONG wait_option);
```

Description

This service reads a packet from a previously opened file. It should be called repetitively until a status of NX_FTP_END_OF_FILE is received.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.				
packet_ptr	Pointer to destination for the data packet pointer to be stored. If successful, the packet some or all the contains of the file.				
wait_option	Defines how long the service will wait for the FTP Client file read. The wait options are defined as follows: <table data-bbox="617 1155 1308 1270"> <tr> <td>timeout value</td><td>(0x00000001 through 0xFFFFFFFF)</td></tr> <tr> <td>TX_WAIT_FOREVER</td><td>(0xFFFFFFFF)</td></tr> </table> <p>Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.</p> <p>Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.</p>	timeout value	(0x00000001 through 0xFFFFFFFF)	TX_WAIT_FOREVER	(0xFFFFFFFF)
timeout value	(0x00000001 through 0xFFFFFFFF)				
TX_WAIT_FOREVER	(0xFFFFFFFF)				

Return Values

NX_SUCCESS	(0x00)	Successful FTP file read.
NX_FTP_NOT_OPEN	(0xD5)	FTP Client is not opened.
NX_FTP_END_OF_FILE	(0xD7)	End of file condition.
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Read a packet of data from file "my_file.txt" that was previously opened
   from the client "my_client." */
status = nx_ftp_client_file_read(&my_client, &my_packet, 200);

/* If status is NX_SUCCESS, the packet "my_packet" contains the next bytes
   from the file. */
```

nx_ftp_client_file_rename

Rename file on FTP Server

Prototype

```
UINT nx_ftp_client_file_rename(NX_FTP_CLIENT *ftp_ptr, CHAR *filename,
                               CHAR *new_filename, ULONG wait_option);
```

Description

This service renames a file on the FTP Server.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
filename	Current name of file.
new_filename	New name for file.
wait_option	Defines how long the service will wait for the FTP Client file rename. The wait options are defined as follows:
timeout value	(0x00000001 through 0xFFFFFFFF)
TX_WAIT_FOREVER	(0xFFFFFFFF)
	Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.
	Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.

Return Values

NX_SUCCESS	(0x00)	Successful FTP file rename.
NX_FTP_NOT_CONNECTED	(0xD3)	FTP Client is not connected.
NX_FTP_EXPECTED_3XX_CODE	(0xDD)	Did not receive 3XX (ok)
response		

NX_FTP_EXPECTED_2XX_CODE

	(0xDA)	Did not get a 2XX (ok) response
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```

/* Rename file "my_file.txt" to "new_file.txt" on the previously connected
   Client instance "my_client." */
status = nx_ftp_client_file_rename(&my_client, "my_file.txt", "new_file.txt",
                                   200);

/* If status is NX_SUCCESS, the file has been renamed. */

```

nx_ftp_client_file_write

 Write to file

Prototype

```
UINT nx_ftp_client_file_write(NX_FTP_CLIENT *ftp_client_ptr,
                             NX_PACKET *packet_ptr, ULONG wait_option);
```

Description

This service writes a packet of data to the previously opened file on the FTP Server.

Input Parameters

ftp_client_ptr	Pointer to FTP Client control block.
packet_ptr	Packet pointer containing data to write.
wait_option	Defines how long the service will wait for the FTP Client file write. The wait options are defined as follows:
timeout value	(0x00000001 through 0xFFFFFFFF)
TX_WAIT_FOREVER	(0xFFFFFFFF)
Selecting TX_WAIT_FOREVER causes the calling thread to suspend indefinitely until a FTP Server responds to the request.	
Selecting a numeric value (1-0xFFFFFFFF) specifies the maximum number of timer-ticks to stay suspended while waiting for the FTP Server response.	

Return Values

NX_SUCCESS	(0x00)	Successful FTP file write.
NX_FTP_NOT_OPEN	(0xD5)	FTP Client is not opened.
NX_PTR_ERROR	(0x07)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Write the data contained in "my_packet" to the previously opened file
   "my_file.txt". */
status = nx_ftp_client_file_write(&my_client, my_packet, 200);

/* If status is NX_SUCCESS, the file has been written to. */
```

nx_ftp_client_passive_mode_set

Enable or disable passive transfer mode

Prototype

```
UINT nx_ftp_client_passive_mode_set(NX_FTP_CLIENT *ftp_client_ptr,
                                     UINT passive_mode_enabled);
```

Description

This service enables passive transfer mode if the `passive_mode_enabled` input is set to `NX_TRUE` on a previously created FTP Client instance such that subsequent calls to read or write files (RETR, STOR) or download a directory listing (NLST) are done in transfer mode. To disable passive mode transfer and return to the default behavior of active transfer mode, call this function with the `passive_mode_enabled` input set to `NX_FALSE`.

Input Parameters

ftp_client_ptr Pointer to FTP Client control block.

passive_mode_enabled
 If set to `NX_TRUE`, passive mode is enabled.
 If set to `NX_FALSE`, passive mode is disabled.

Return Values

NX_SUCCESS	(0x00)	Successful passive mode set.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.
NX_INVALID_PARAMETERS	(0x4D)	Invalid non pointer input

Allowed From

Threads

Example

```
/* Enable the FTP Client to exchange data with the FTP server in passive mode. */
status = nx_ftp_client_passive_mode_set(&my_client, NX_TRUE);

/* If status is NX_SUCCESS, the FTP client is in passive transfer mode. */
```

nx_ftp_server_create

Create FTP Server

Prototype

```
UINT nx_ftp_server_create(NX_FTP_SERVER *ftp_server_ptr,
    CHAR *ftp_server_name, NX_IP *ip_ptr,
    FX_MEDIA *media_ptr, VOID *stack_ptr, ULONG stack_size,
    NX_PACKET_POOL *pool_ptr,
    UINT (*ftp_login)(struct NX_FTP_SERVER_STRUCT
        *ftp_server_ptr, ULONG client_ip_address,
        UINT client_port, CHAR *name, CHAR *password,
        CHAR *extra_info),
    UINT (*ftp_logout)(struct NX_FTP_SERVER_STRUCT
        *ftp_server_ptr, ULONG client_ip_address,
        UINT client_port, CHAR *name, CHAR *password,
        CHAR *extra_info));
```

Description

This service creates an FTP Server instance on the specified and previously created NetX IP instance. Note the FTP Server needs to be started with a call to ***nx_ftp_server_start*** for it to begin operation.

Input Parameters

ftp_server_ptr	Pointer to FTP Server control block.
ftp_server_name	Name of FTP Server.
ip_ptr	Pointer to associated NetX IP instance. Note there can only be one FTP Server for an IP instance.
media_ptr	Pointer to associated FileX media instance.
stack_ptr	Pointer to memory for the internal FTP Server thread's stack area.
stack_size	Size of stack area specified by <i>stack_ptr</i> .
pool_ptr	Pointer to default NetX packet pool. Note the payload size of packets in the pool must be large enough to accommodate the largest filename/path.
ftp_login	Function pointer to application's login function. This function is supplied the username and password from the Client requesting a connection. If this is

valid, the application's login function should return NX_SUCCESS.

ftp_logout

Function pointer to application's logout function. This function is supplied the username and password from the Client requesting a disconnection. If this is valid, the application's login function should return NX_SUCCESS.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Server create.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.

Allowed From

Initialization and Threads

Example

```
/* Create the FTP Server "my_server" on the IP instance "ip_0" using the
   "ram_disk" media. */
status = nx_ftp_server_create(&my_server, "My Server Name", &ip_0, &ram_disk,
                             stack_ptr, stack_size, &pool_0,
                             my_login, my_logout);

/* If status is NX_SUCCESS, the FTP Server has been created. */
```

nx_ftp_server_delete

Delete FTP Server

Prototype

```
UINT nx_ftp_server_delete(NX_FTP_SERVER *ftp_server_ptr);
```

Description

This service deletes a previously created FTP Server instance.

Input Parameters

ftp_server_ptr Pointer to FTP Server control block.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Server delete.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Delete the FTP Server "my_server". */
status = nx_ftp_server_delete(&my_server);

/* If status is NX_SUCCESS, the FTP Server has been deleted. */
```

nx_ftp_server_start

Start FTP Server

Prototype

```
UINT nx_ftp_server_start(NX_FTP_SERVER *ftp_server_ptr);
```

Description

This service starts a previously created FTP Server instance.

Input Parameters

ftp_server_ptr Pointer to FTP Server control block.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Server start.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.

Allowed From

Initialization and Threads

Example

```
/* Start the FTP Server "my_server". */  
status = nx_ftp_server_start(&my_server);  
  
/* If status is NX_SUCCESS, the FTP Server has been started. */
```

nx_ftp_server_stop

Stop FTP Server

Prototype

```
UINT nx_ftp_server_stop(NX_FTP_SERVER *ftp_server_ptr);
```

Description

This service stops a previously created and started FTP Server instance.

Input Parameters

ftp_server_ptr Pointer to FTP Server control block.

Return Values

NX_SUCCESS	(0x00)	Successful FTP Server stop.
NX_PTR_ERROR	(0x16)	Invalid FTP pointer.
NX_CALLER_ERROR	(0x11)	Invalid caller of this service.

Allowed From

Threads

Example

```
/* Stop the FTP Server "my_server". */
status = nx_ftp_server_stop(&my_server);

/* If status is NX_SUCCESS, the FTP Server has been stopped. */
```
